

# *Macroeconomic and Industry Impacts of Currency Valuation: A Global Modeling Analysis*

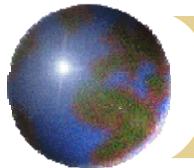

**Jeff Werling**  
**INFORUM/Dept of Economics**  
**University of Maryland**  
**June 27, 2005**  
**[werling@econ.umd.edu](mailto:werling@econ.umd.edu)**

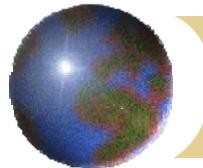

# *Overview*

- Is U.S. current account sustainable?
- Exchange rate scenarios using Inforum's international modeling system:
  - 25% RMB only
  - 25% All Asian currencies
  - 25% All currencies, U.S. financial markets tranquil
  - 25% All currencies, U.S. financial markets turbulent

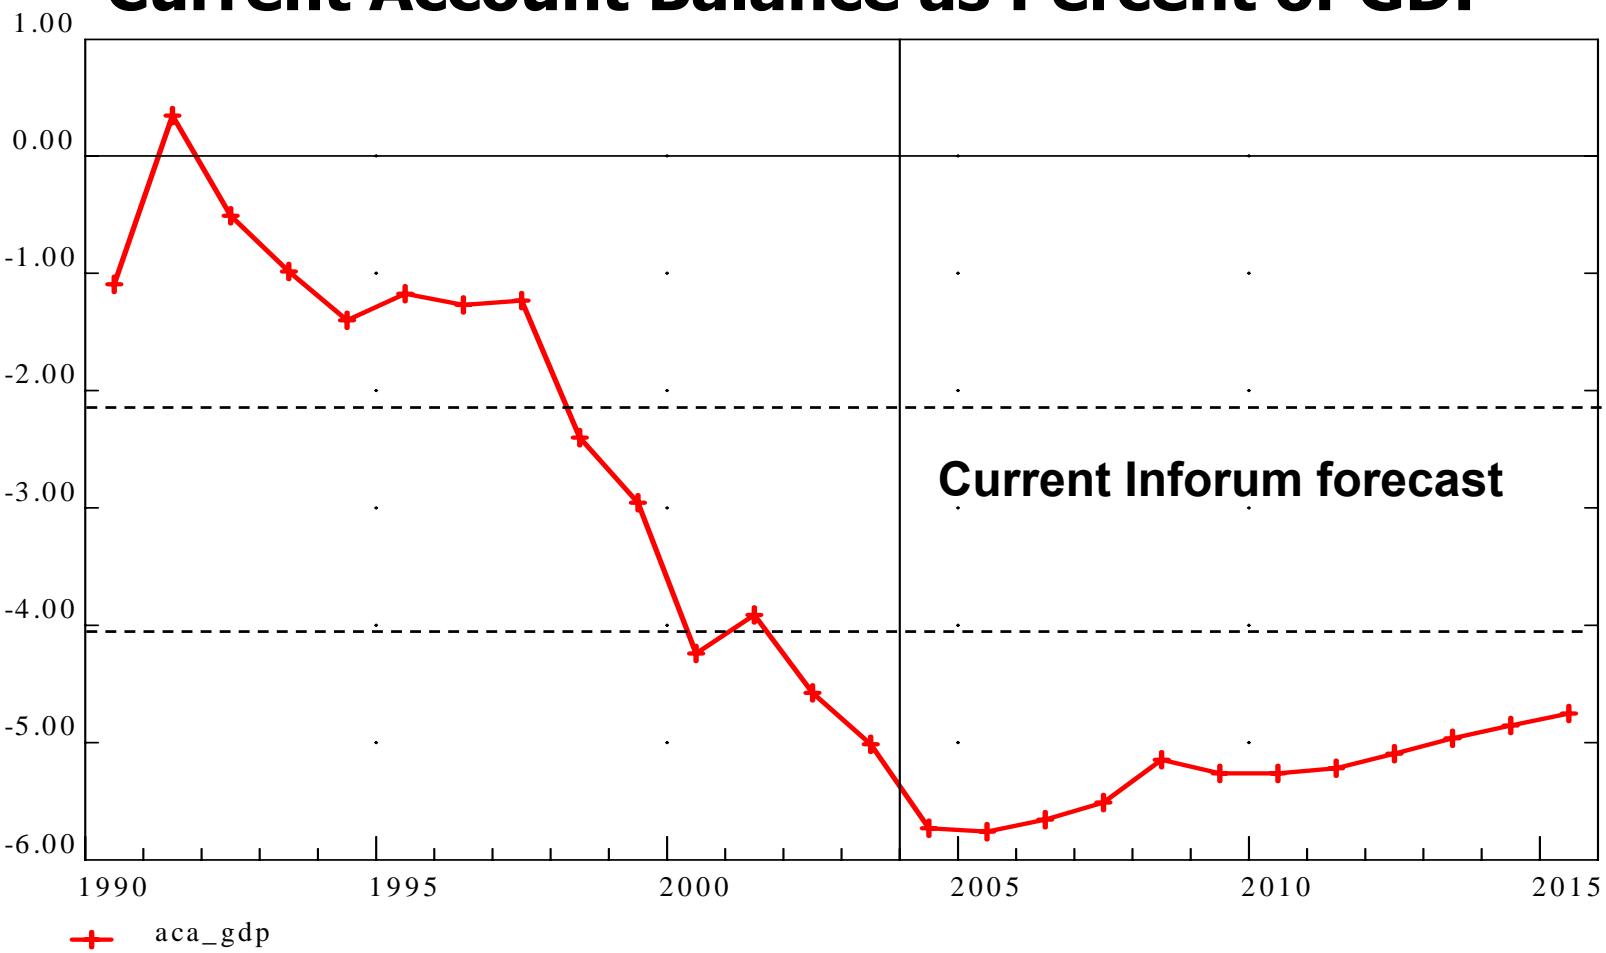

## ***Inforum Models***

- **Combine input-output structure with econometric equations in a dynamic and detailed framework.**
- **Like a CGE: Contains detailed industry structure and *bottom-up* accounting.**
- **Like an (macro) econometric and/or VAR model: Parameters estimated from actual data. Portrays dynamic evolution of economies over actual time periods.**
- **Lift (Long-term interindustry forecasting tool) is 97 sector flagship model. Under continuous development and use for 30 years.**
- **Iliad - detailed 310 sectors.**
- **International System: BTM bilateral trade model, IM models for all major trade partners including China (Mudan).**

# *Is the U.S. current account sustainable?*

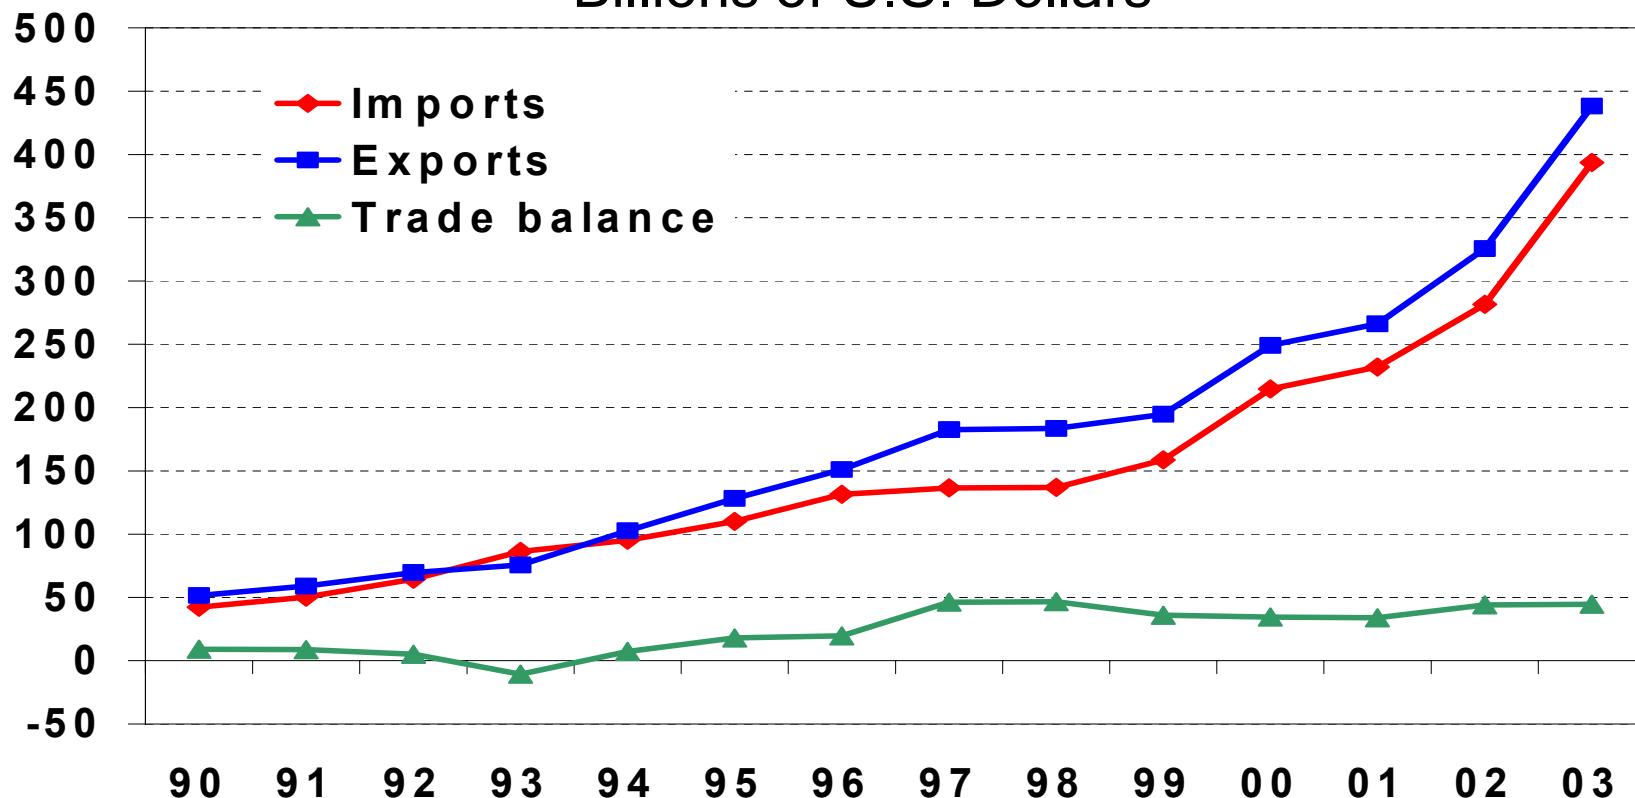

## Current Account Balance as Percent of GDP

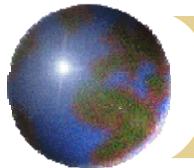

## ***China's overall trade surplus has been level.***

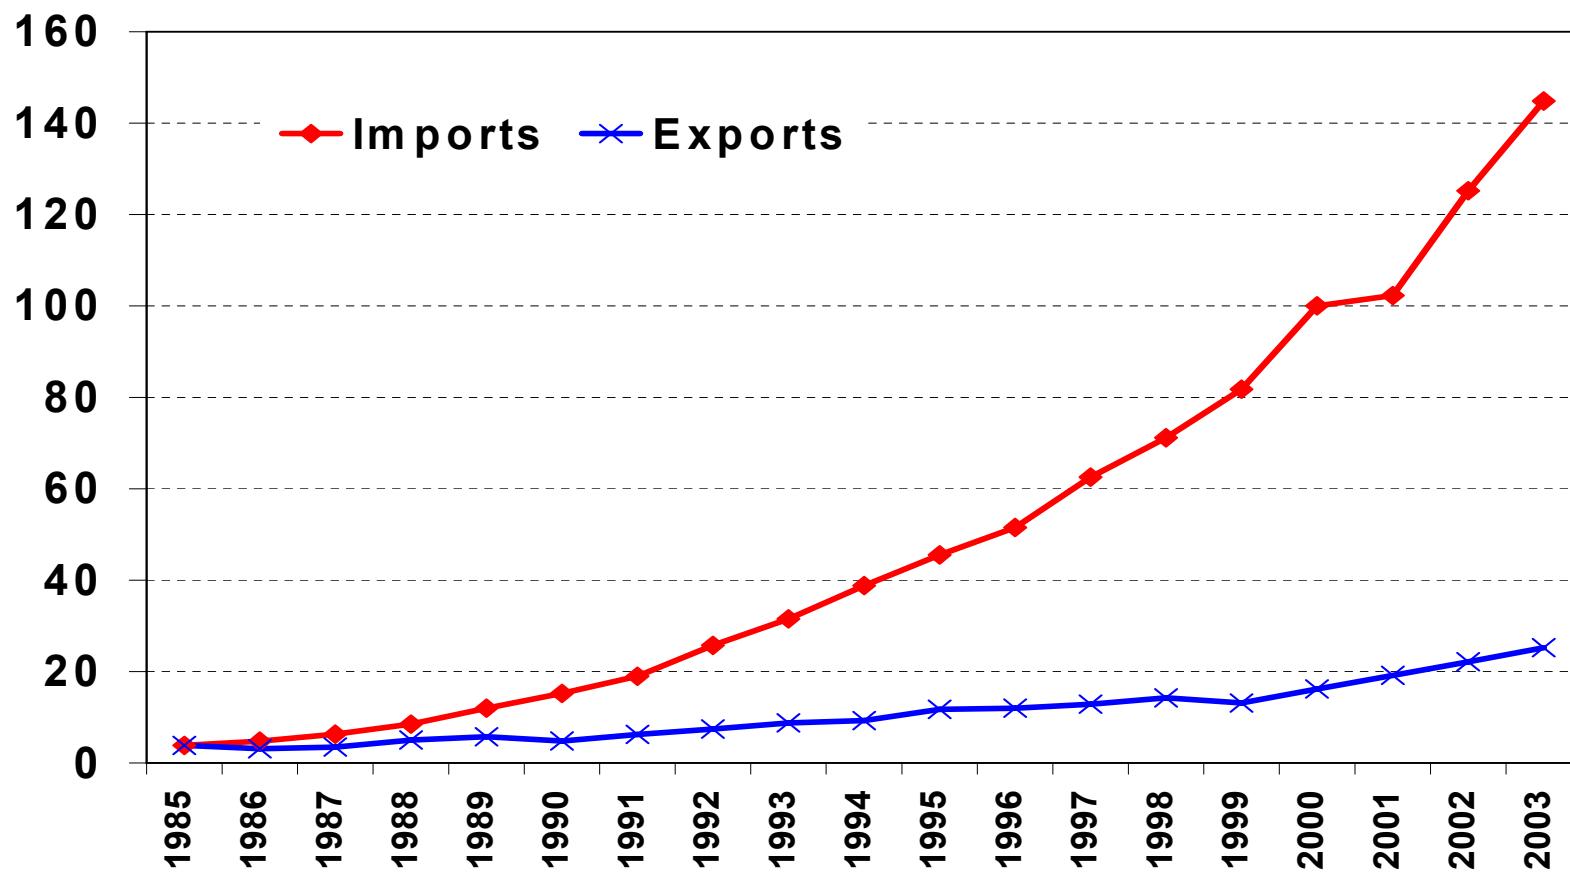

Foreign Trade, People's Republic of China  
Billions of U.S. Dollars

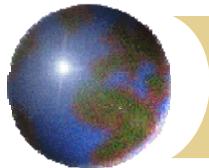

## ***U.S. Import Demand Driving Trade***

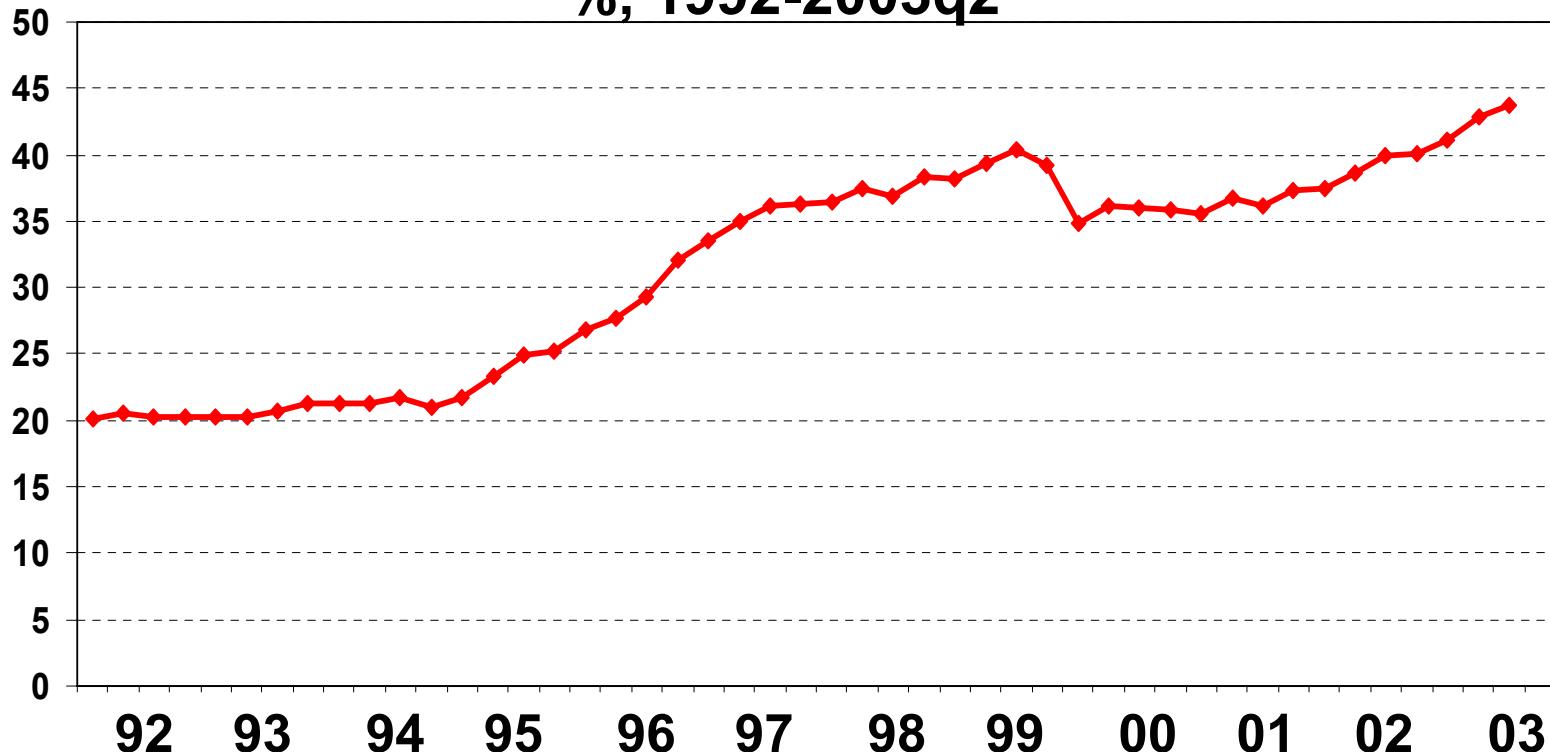

U.S. Foreign Trade with China  
Billions of U.S. Dollars

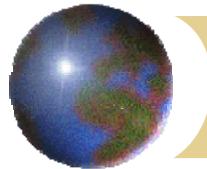

## *Co-dependency: Asians enable federal deficits in order to sustain exports*

Foreign Ownership of Federal Securities in Private Hands  
%, 1992-2003q2

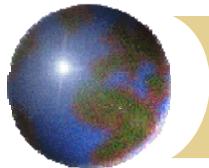

Source: U.S. Treasury Department

## ***Modeling exchange rates and the current account***

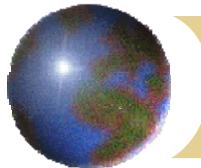

- $X - M = S - I$  : any ER induced changes to trade balance must have corresponding impact on I or S.
- Expenditure switching vs. Expenditure reduction.
- Expenditure Switching: Currency changes impact trade through relative price changes. Imports discouraged, exports increase.
- What is the impact on S/I balance?
  - Higher inflation lifts interest rates, hitting investment.
  - Inflation hits real asset values, boosting household savings.
- Expenditure switching depends on impact on import and domestic prices. For any given commodity and year:

$$\Delta PM = \sum_j w_j * PX_j * \Delta er_j * pt_j$$

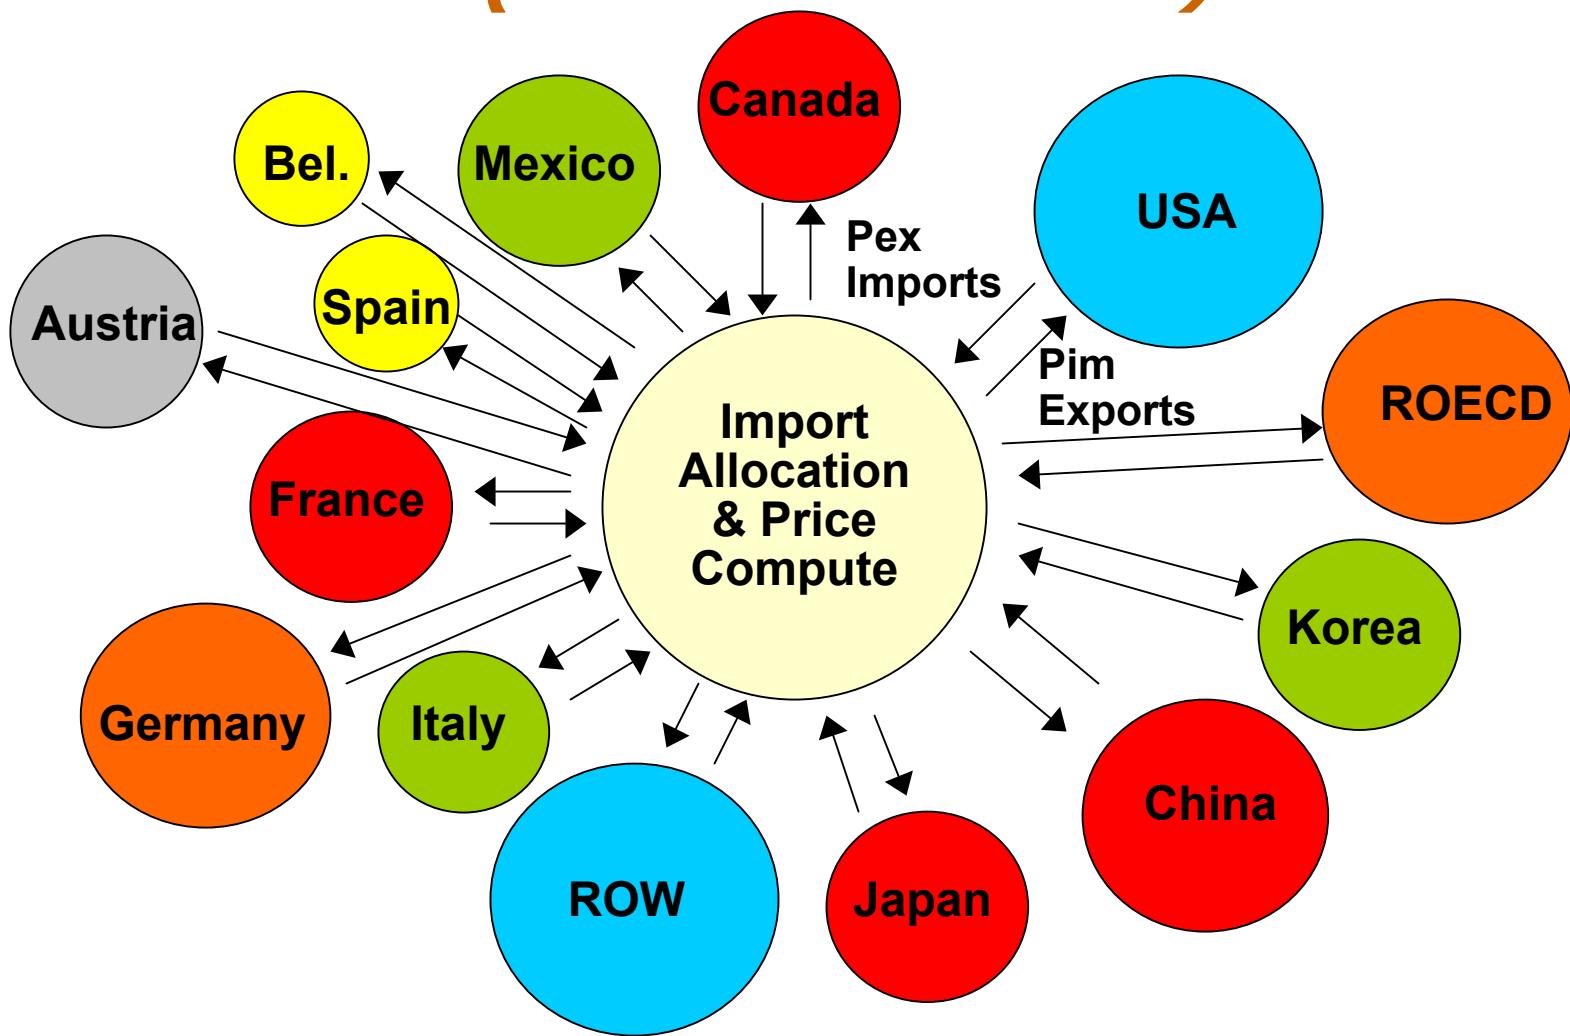

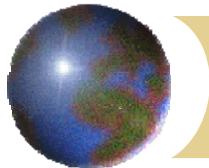

## ***Modeling exchange rates and the current account***

- Evidence exists that currency pass-through to import prices is limited (25-50%). Pass-through depends on breadth and depth of appreciation.
- U.S. imports are relatively price inelastic (~.7-.9), but income elastic.
- U.S. export price elasticity ~ 1, but weakness in trading partners could delay export growth.
- Expenditure reduction: At given prices, reduction of domestic income hits consumption/investment or increases savings at given income.
- Asian crisis reversed CA deficits quite rapidly by implosions of absorption.
- In U.S., will significant current account reduction require large decrease of income?

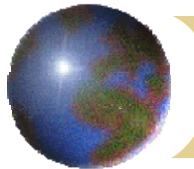

## *Feed new exchange rates into Bilateral Trade Model ( 120 commodities)*

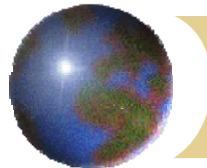

## ***Will (unilateral) 25% RMB appreciation matter to China?***

- Yes. To extent that Chinese exporters modify prices, impact on exports might be significant as competitors take advantage of currency revaluation. (Bilateral price elasticities are very high.)
- Therefore, would a narrow appreciation be accompanied by large pass-through?
- Over three years, a unilateral devaluation reduces Chinese nominal exports to U.S. by 20-30% ! (i.e., one year's growth).
- Raises costs and asset prices. Might reduce FDI growth.  
(But I doubt it.)
- Currency appreciation is important facet of economic development.
- Decrease inflationary pressure. Flexible currency will give China better control over monetary policy.
- Increase domestic income and demand in China.
- Financial system considerations.

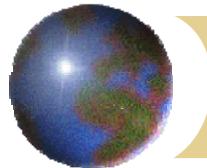

## ***Will (unilateral) 25% RMB appreciation matter to the United States?***

- Effect on United States will depend on the impact on import prices.
- Expenditure switching:  $\Delta PM = \sum_j w_j * PX_j * pt_j * \Delta er_j$ 
  - China's share of U.S. imports 13% (2004)
  - Pass through: 50% (generous and over time)
  - Revaluation: 25% (assumed one time adjustment)
  - $\Delta PM = .13 * .25 * .50 = .0163$
  - That is, U.S. import prices will rise by a whopping 1.6%. Change in overall imports will be small.
  - Moreover, effect on consumer prices and interest rates are small so change in S – I and current account trivial.
  - Since price elasticity is less than one, nominal imports will rise!
  - Bi-lateral exports to China will expand.

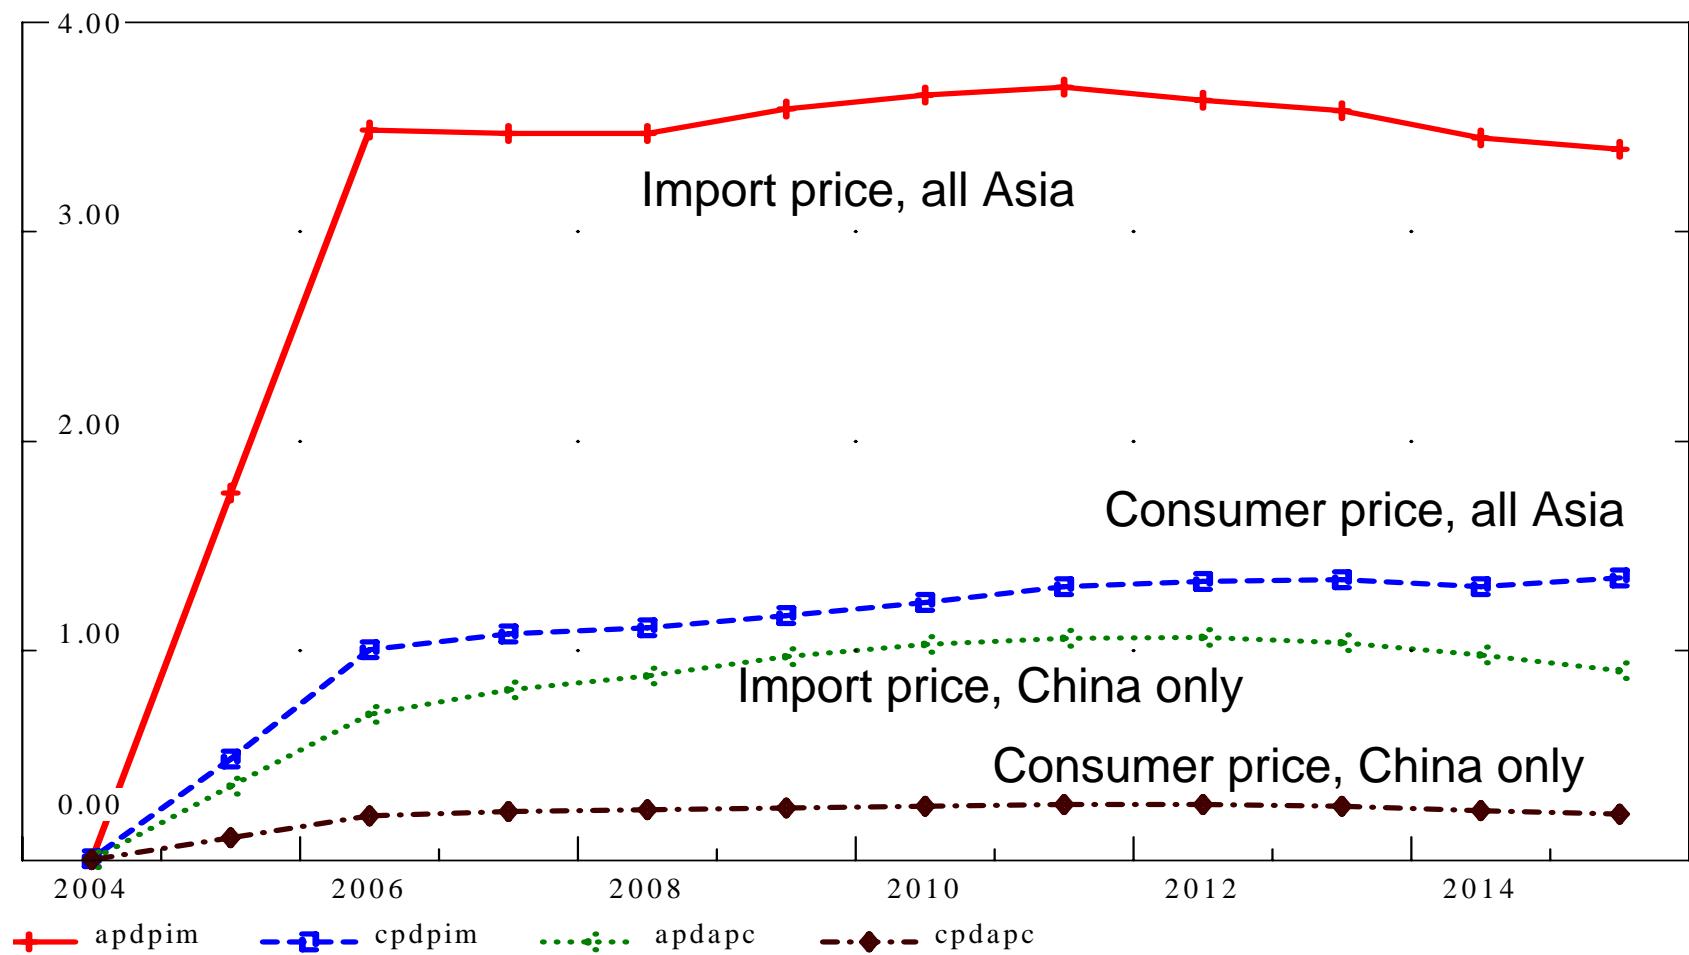

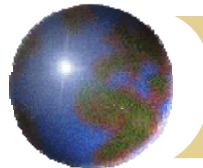

## ***Will Asian supply-chain 25% appreciation matter?***

- Effect on United States will depend on the impact on import prices.
- Expenditure switching:  $\delta PM = \sum_j w_j * PX_j * pt_j * \delta er_j$ 
  - Asia's share of U.S. imports 30% (2004)
  - Pass through: 50% (generous and over time)
  - Revaluation: 25% (assumed one time adjustment)
  - $\delta PM = .30 * .25 * .50 = .0375$
  - That is, U.S. import prices will rise by 3.75%. Impacts on consumer prices now noticeable.
  - Still, since price elasticity is less than one, nominal imports will rise!
  - Exports to Asia boosted significantly.

## ***Impact on import and consumer prices (percent deviation)***

## Dollar vs. RMB only and all Asia: Macro results

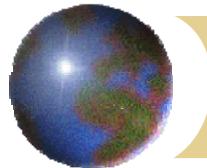

Table 1: Macroeconomic Effects of Asian Revaluation Scenarios

Alternatives are shown in percentage deviations from base unless otherwise noted.

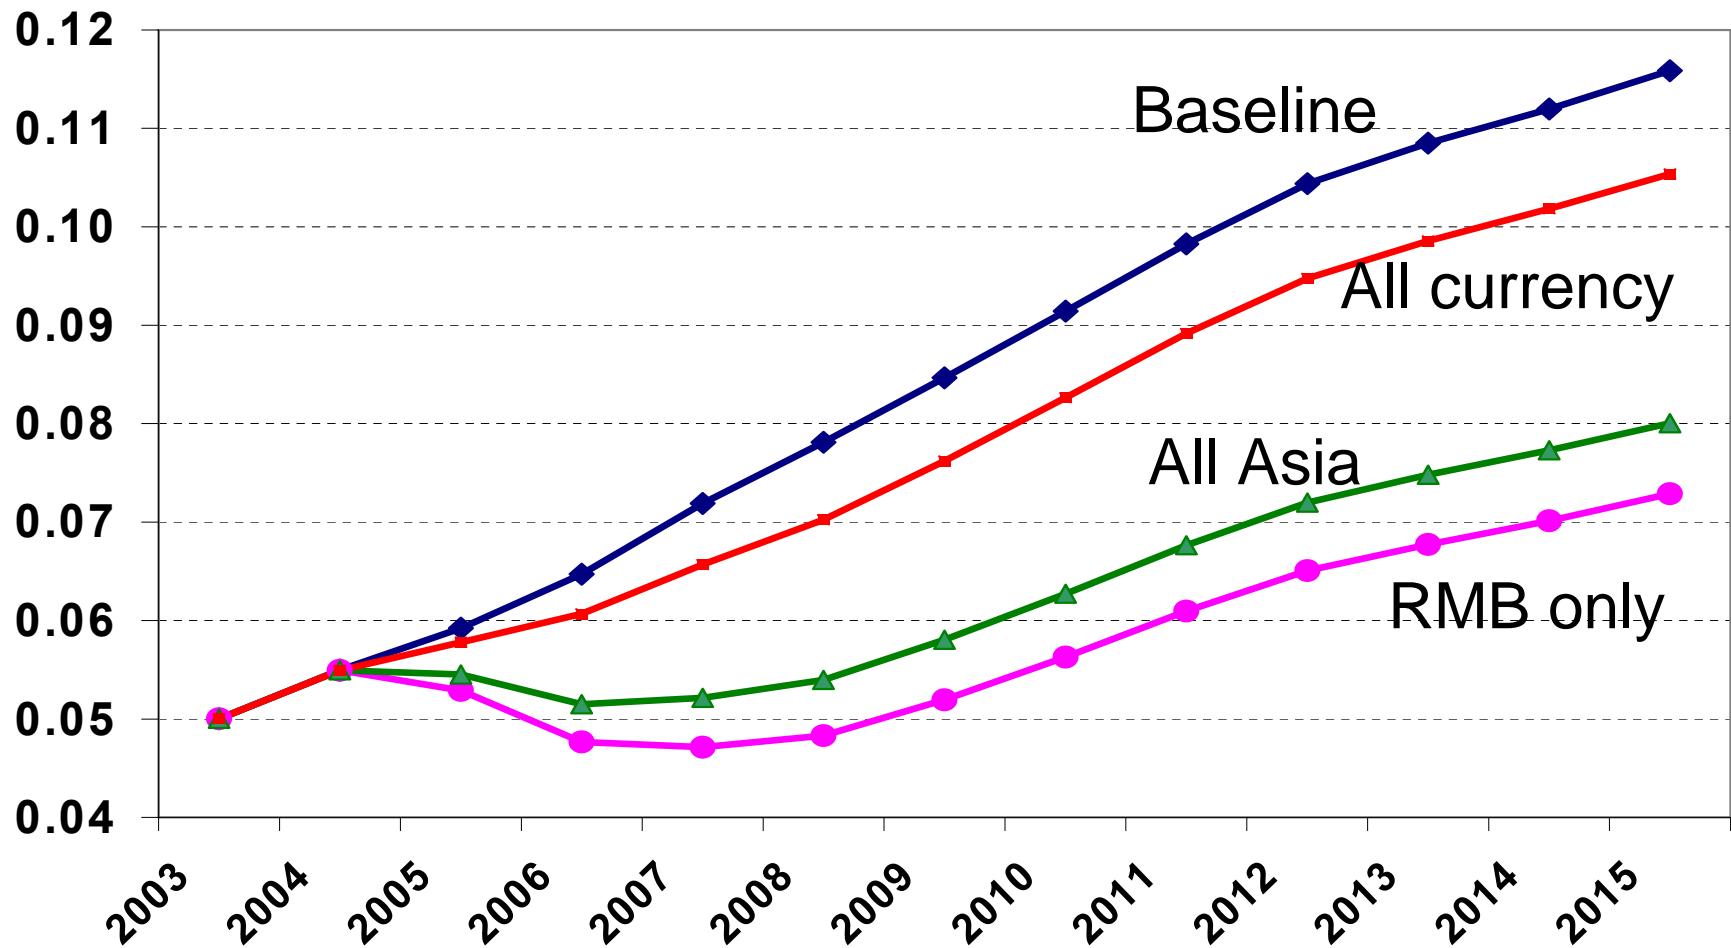

Line 1: Dollar falls 25% against yuan only

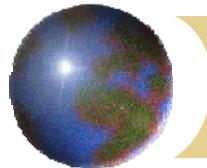

Line 2: Dollar falls 25% against all Asian currencies

# **Reflection: What could happen?**

- **Unilateral Chinese revaluation or narrow-based Asian revaluation will have only minor impacts on U.S. current account deficit.**
- **U.S. Current Account deficit reduction will require large and widespread dollar depreciation**
- **Is There A Free Lunch? Or will dollar depreciation be accompanied by *real interest rate increases and asset price deflation*, and, therefore, output and significant welfare losses.**
- **One-time exchange rate and interest rate shocks shown here produce only moderate current account changes and marginal losses of income and employment (no recession).**
- **A series of similar shocks would be required to balance the account, but could produce significant hardships.**
- **Manufacturing will expand if trade deficit to be closed. Domestic income and consumption growth will fall and residential construction will contract.**
